10. Tips & Troubleshooting

1. Getting Started

Winamp — Reconstructed is a single self-contained HTML file. There is nothing to install and no account to create.

- Open the **.html** file in any modern desktop browser (Chrome, Firefox, Edge, Safari).
- Click **EJECT — LOAD FILE(S)**, or drag audio files anywhere onto the player, to build your playlist.
- Click a track in the Playlist Editor, or press **Play**, to start listening.

Everything runs locally in your browser. Your audio files are never uploaded anywhere — all processing happens on your own device.

2. The Main Player

LCD Display

- Large green digits show elapsed time — **click the time** to toggle between elapsed and remaining.
- STEREO and EQ status lights sit beneath the clock and light up once a track is loaded / the EQ is enabled.
- The amber spectrum strip is the inline visualizer — click it to cycle modes, double-click for fullscreen.
- kHz / kbps readouts sit to the right of the display.

Transport & Controls

- Standard Previous / Play / Pause / Stop / Next transport buttons.
- The seek bar below the display can be dragged to jump anywhere in the track.
- **VOL** and **BAL** sliders control volume and stereo balance — **double-click BAL** to instantly recenter it.
- The **EQ / PL / RPT / RND / ART** buttons on the right show or hide the Equalizer, Playlist, and Album Art windows, and toggle Repeat / Shuffle playback modes.

3. Playlist Editor

- **ADD** or the main **EJECT** button opens a file picker for multiple audio files at once.
- **REM** removes the currently selected track; **CLEAR** empties the whole playlist.
- **SHUFFLE** randomizes the list order once (a one-time reshuffle, distinct from the continuous shuffle-playback toggle described in Section 7).
- **Search box** at the top of the playlist filters the list live as you type — clear it with the ✕ to see everything again.
- **Drag and drop** any track onto another to reorder the list (disabled while a search filter is active).

- A small play-count badge next to each track shows how many times it's been played through to completion.

> *If tracks appear greyed out and italic marked “needs re-add”, they're names remembered from your last session — browsers don't allow a webpage to silently re-read files from disk, so click **EJECT** to re-add them. Once re-added, the actual audio is stored for future sessions and this won't happen again for that file.*

4. Equalizer

- 10 bands from 60 Hz to 16 kHz, each adjustable ±12 dB, driven by real audio filters.
- The **ON** button bypasses the entire EQ without losing your slider settings.
- The **Presets** dropdown includes Flat, Rock, Pop, Jazz, Classical, Bass Boost, Treble Boost, and Vocal.
- The blue curve above the sliders is a live readout of your current EQ shape.

5. Visualizers & Fullscreen Mode

Click the visualizer strip in the LCD display to cycle through four modes:

- **Bars** — classic amber/orange spectrum analyzer.
- **Scope** — green oscilloscope waveform.
- **Radial** — a rotating, color-cycling polar spectrum.
- **Geiss** — a feedback-plasma mode in the spirit of the classic Geiss plugin, blooming and warping frame-to-frame with the bass/mid/treble of the track.

Double-click the visualizer to open it fullscreen. In fullscreen you get a simplified transport (Play/Pause, Stop, Next, Volume) plus a large album art panel in the top-right corner. Single-click still cycles modes; double-click again, press **Esc**, or use the **✕** to exit.

6. Album Art

- Toggle the **ART** window on or off from the main player controls.
- Cover art embedded in MP3 files (ID3 tags) is detected and shown automatically.
- No embedded art? Click the art frame to pick any image of your own as a custom cover — it's remembered for that track from then on.
- The number of times a track has played is shown just below its title in this window.

7. Repeat & Shuffle

- **RPT** cycles through Off → Repeat All → Repeat One (shown as “RPT·1”).

- **RND** toggles continuous shuffle playback — Next and auto-advance both pick a random track instead of playing in order.
- Both settings are remembered the next time you open the player.

8. Keyboard Shortcuts

Space	Play / Pause
← / →	Seek backward / forward 5 seconds
↑ / ↓	Volume up / down
Esc	Close fullscreen visualizer

Shortcuts are ignored while a text field, dropdown, or slider has keyboard focus, so they won't interfere with normal typing.

9. Your Data & What Gets Saved

The player automatically remembers your setup between visits, using your browser's local storage — nothing is ever sent to a server.

- **Equalizer** — all band levels, the selected preset, and ON/OFF state.
- **Volume & balance.**
- **Visualizer mode**, and which of the EQ / Playlist / Art windows are open.
- **Repeat & shuffle** settings.
- **The playlist itself** — the actual audio files (not just their names) are stored so tracks are genuinely playable again after closing and reopening.
- **Album art** and **play counts** for every track.

This all relies on your browser keeping local storage for the file, so it works best when you save the HTML file and open it directly, rather than only viewing it in a temporary preview.

10. Tips & Troubleshooting

- **No sound on first Play?** Most browsers block audio until you interact with the page — click Play once and it will start normally from then on.
- **Tracks show but won't play after reopening?** They're likely leftover “remembered” entries from before a file was re-added — click EJECT to reload them for good.

- **Want a clean slate?** Use CLEAR in the Playlist Editor — it wipes both the visible list and the stored data behind it.
- **Storage seems to not be sticking?** Some private/incognito windows restrict persistent storage — use a normal browser window for full autosave support.

Enjoy the tunes.
